### **Novinity Software announces its new PAT toolkit™ software for the FDA's Process Analytical Technology (PAT) initiative**

Bozeman, Montana (March 21, 2006) – Novinity Software announced today that it will be releasing its new PAT toolkit™ software that allows pharmaceutical manufacturers the ability to monitor their production processes with near real-time visibility for quality decisions.

The idea for the software was first developed and implemented in 1998 based on extremely strict quality parameters for radiopharmaceutical production. It works by plugging into existing pharmaceutical manufacturing equipment such as historians and SCADA systems to collect, organize, store, and analyze information. This information can be further built upon by integrating with an analytical software package such as Northwest Analytical's Quality Analyst 6.1. All this information is then funneled into a user-defined report and delivered via a Web-based interface and email.

The critical feature of the software is that these reports are accessible as the process occurs and report on whatever the manufacturer would like to observe. With this information, users know instantly if their processes have deviated from their quality standards during production. This prevents further production of an inferior drug, thus saving time and materials. According to Lance Tinseth, President of Novinity Software, "PAT toolkit™ is the next platform in applied technology that simplifies a client's regulatory responsibilities while simultaneously assisting them to meet their business goals."

With the FDA's Process Analytical Technology initiative, the software is designed to help the manufacturer implement a PAT strategy on whatever level the user feels appropriate. Over time the software can grow and change with the user's needs, all the while allowing them near real-time access to information on the quality status of their production runs.

For additional information contact: (Jacob Cook, 206.347.1020, [jake@pattoolkit.com](mailto:jake@pattoolkit.com))

PAT toolkit™ allows pharmaceutical manufacturers to maximize their investment in production by minimizing time to market while simultaneously increasing quality.

### **About Novinity Software**

Novinity Software ([www.novinitysoftware.com](http://www.novinitysoftware.com)) is an industry leader in Automated Data Management Systems (ADMS). Novinity was established to help their clients achieve higher levels of success by helping them to improve quality and productivity. Novinity's service and product focus is to provide maximum benefits while minimizing the costs of implementing software solutions.
